“If we want things to stay as they are, things will have to change.”

Giuseppe Tomasi di Lampedusa

Introduction

It's no secret that the US job market has undergone dramatic disruption since the start of the decade. After the COVID-19 pandemic launched a new wave of remote work and sent the unemployment rate soaring, we saw an overcorrection into worker shortages and one of the tightest labor markets on record. The highest inflation in forty years led to a sharp increase in interest rates, meaning that funding dried up across industries and organizations of every size felt the effects. A growing bifurcation in the labor market has developed: college-educated information workers see fewer opportunities available even as demand for workers in hands-on industries grows. Culturally, “The Great Resignation” and “quiet quitting” have reflected workers’ changing relationship to their work, particularly as many return-to-office policies remain unresolved.

It's abundantly clear that the labor market today is much different than the labor market of three years ago. Establishing that there is a difference isn't the problem; the problem is quantifying what, exactly, has changed, and identifying who is affected, and by how much.

Change in the labor market is often gauged through job transitions, and jobs created and lost. If a new firm opens and hires hundreds of workers, or if fewer young people are choosing to pursue careers in a given industry, it's clear to see how that reflects a change in the labor market.

But that doesn't tell the whole story. **Even if a job isn't created or lost, it can still change.**

A worker might stay in their job for years, or a company might maintain a consistent staff with the same job titles, but if the tasks and abilities

needed to accomplish those jobs are different, then it would be ignorant to say that they're the same as they always were.

Job titles are not a reliable indicator of change in the labor market, **but skills are**. If the skill compositions of work change enough, the jobs themselves can end up being fundamentally different.

Over the past three years, the average job has seen one third of its skills change.

Skills are the base unit of the labor market, and that means they are the shared language that should be used to understand supply, demand, and market trends. At their most basic level, every worker has a skill set, and every job is a set of tasks, knowledge, and abilities that requires those skill sets, and the labor market is about matching the two together.

This can illuminate differences beneath the surface of a shared job title. So if a large employer were to post a job for a “software developer,” they might be seeking someone who writes code in C++ and can communicate clearly in Scrum meetings while focusing on specific components of a larger system. Meanwhile, a startup hiring a “software developer” might be looking for a generalist who writes code in Ruby, can handle both front-end and back-end tasks, and is flexible enough to pivot as product needs evolve. The different skills requested in their respective job postings would indicate the differences between the roles, even though the job titles would be the same.

This difference in skills despite a shared job title can also be applied over time: if job postings for a “writer” in 2021 required drafting, editing, and grammar skills, but postings in 2025 require prompt engineering and familiarity with generative AI models, it's clear something has changed—a shift not visible if you only looked at the job title on its own.

Lightcast job postings data can identify the skills required for every occupation on the market, refined and classified by every sector, industry, and employer. By comparing postings in 2024 to postings in 2021, we can quantify the exact degree of difference between them.

In the appendix, you can see a breakdown of every occupation by its “Skill Disruption Index” score, on a scale of 0 to 100.

Taking the average of all occupations on that list is how we found that the average job has experienced turnover for nearly a third of its skills. By using skills to track the trend lines over the past three years, we can identify the overall scope of change throughout the labor market, as well as pull out specific skill trends that have seen exceptional growth over this period, signaling their growing importance

in 2025 and beyond. After studying which skills, roles, and industries have been most affected, our key findings reveal the greatest change in three fields: AI, sustainability, and cybersecurity.

Within those three key themes and across the broader market, it's clear that skills have changed dramatically, and the pace of that change is accelerating. Rapid change demands urgent action. This is not a time to wait and see, because by the time you're done waiting, you'll realize that the goalposts have shifted even further. A proactive workforce strategy is the only way to move ahead of the curve. Developing that strategy requires a data-driven understanding of the current state of your workforce, predicting for the future, and setting clear goals to bridge the gaps.

Standing still when labor market disruption is happening so quickly is a sure way to be left behind. And to understand what paths to follow, the first step is to understand the change that's already happening.

Key Findings

The average job has seen **one-third** of its skills change from 2021 to 2024.

One in four jobs (the top quartile) has seen **75%** of their skills change in 3 years.

AI is causing more **disruption** than any other trend, followed by sustainability and cybersecurity.

The pace of skill change is **accelerating**: the disruption of the past three years is similar to that of the previous five.

When receiving a job offer, filling a role you're hiring for, or graduating a student into the workforce, it can often feel like crossing a finish line: a person has acquired the skills they need to be hired for a job that requires those skills. It's tempting to just think "mission accomplished" and move on to the next task, but in fact, the work has just begun.

If one third of the job's skills will change in three years, then it's already time to start professional development, upskilling, and even reskilling in order to prepare that worker for what their job needs to be in the future. This is all the more true for occupations on the upper end of the disruption scale, which have seen over twice as much skill turnover than the average job.

Looking at the skill disruption scores for specific roles or industries offers interesting individual insights. If your organization employs a large number of computer scientists and developers, two of the most disrupted occupations in the chart on the next page, knowing where the market is moving and how you stack up to your competitors becomes increasingly important.

But as valuable as those specific applications are, the overall picture presents an even stronger narrative: **every job is changing, and in a labor market where everything is in flux, being future-ready means being flexible and anticipating that change will come.** What could that look like?

Matching your internal skill names to industry standards improves

efficiency when trying to better understand your workforce or benchmark it against your competitors, regions, or industry.

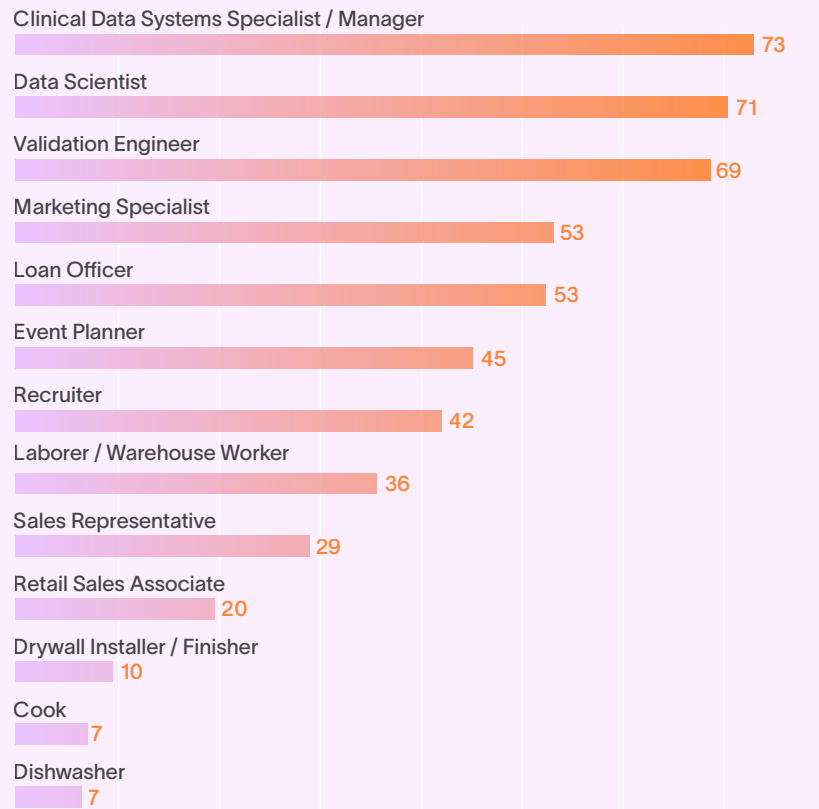

When you connect internal role data with external labor market data, you remain agile as skills change and job markets shift. By knowing what capabilities are already present in your workforce, you can reduce unnecessary outside hiring when new needs arise, which saves money in recruiting and headcount.

Anticipating the future is never easy, but using labor market data to understand the patterns present in the market today, and the trends that led to this current state, will allow for more confident predictions moving forward.

Highlights from the data

Skill disruption varies widely across industries and occupations

Skill disruption index scores (0-100) for select occupations across the labor market. A higher score means the occupation has experienced more disruption.

Source: Lightcast

The most disrupted occupations are concentrated in STEM fields

Top disrupted occupations by Skill Disruption Index value, 2021-2024

Source: Lightcast

Speeding Up

Not only have skills changed dramatically, they are changing faster and faster.

The speed of skill change was the subject of a previous [Lightcast report, published in 2022](#) and analyzed US job postings between 2016 and 2021. That report—which covered a five-year period—showed similar results to those we’ve found over the past three years. The previous results showed 37% of the average skills were different over five years (compared to 32% now), with 76% disruption in the top quartile (compared to 75% now).

Comparing 32% of the average job’s skill change now to 37% in the previous report means the difference is 13.5% smaller, but the timeframe (three compared to five years) is around 40% smaller. If the degree of change continues to accelerate, what will the job market look like in three years? Or even in one?

Even within the previous report, the pace of skill change was accelerating. At the time, we wrote that “Nearly three-quarters of jobs changed more from 2019 through 2021 (during which time the

compound annual growth rate was 22%) than they did from 2016 through 2018 (19%).”

This trend is shown below, with several occupations seeing similar change from 2024 to 2021 as they saw from 2021 to 2016. In some cases, including Mobile Applications Developer, Solar Engineer, and Security/Defense Intelligence Analyst, the three-year difference was even greater than the five-year difference.

Disruption for tech jobs has increased over the last four years

Difference in Skill Disruption Index scores, 2016–2021 compared to 2021–2024

A Tale of Two Labor Markets

The bottom quartile of jobs, those that are least disrupted, have seen only an average of 8% of their skills change. Does that mean those industries are stable and thriving? Far from it.

In contrast to highly-disrupted jobs in tech and healthcare that usually require a college degree and extensive training, the least-disrupted jobs have lower educational requirements and are often more physical in nature. This includes the occupations of Dishwasher, Cook, Drywall Installer, Retail Sales Associate, and Laborer/Warehouse Worker. Even though new technologies may soon disrupt these lower-wage jobs, as they increasingly rely on digital tools in warehouses and on the retail floor, our data shows that their core tasks have so far remained similar.

See our breakdown of every occupation by its “Skill Disruption Index,” score on a scale of 0 to 100 in the [appendix](#).

According to Lightcast research, there’s a storm coming—a demographic and workforce crisis by the end of the decade that will see crucial worker shortages in critical industries, including food service, retail, and construction and the skilled trades—industries that are among the largest in the US for total workers employed.

[The Rising Storm](#), a research release from Lightcast, details how young workers are putting off getting their first job, and the majority are pursuing four-year degrees in hopes of finding a professional, office-centered job. Lightcast data reveals that nine out of the ten occupations with the most job postings in the US do not require a college degree—and several of those (including Retail Sales Associate, Fast Food and Counter Worker, and Laborer/Warehouse Worker) overlap with the jobs least disrupted over the past three years.

Many of these occupations are also those most often filled by older workers, including (once again) Laborer/Warehouse Workers and

Retail Sales Associates, as well as Building Cleaning Workers and Truck Drivers—and older workers are quickly dropping out of the workforce as Baby Boomers retire en masse. Out of the five million people in the US who have left the workforce since 2020, four million are over 55.

If we use the analogy of a hurricane (as *The Rising Storm* does) then a storm is coming for everyone, but the damage will be more severe in some areas than others. Construction, healthcare, retail, and food and hospitality are on high alert, right in the storm’s path, while professional fields like tech and finance look safer.

So pick your poison: jobs with the highest skill disruption are those with the most reliable talent pipelines of college-educated workers, but jobs that look safest from a skill-change perspective are at the greatest risk of demographic challenges and worker shortages. From a workforce planning perspective, every occupation has its risks, and a lower skill disruption score doesn’t mean clear sailing ahead.

Three Big Themes

Adapting to AI

Generative AI has rapidly transformed the job market, impacting tech and non-tech roles alike.

The Growth of Green Skills

The green economy is expanding, driving demand for green skills in both traditional and non-traditional roles.

Cybersecurity Skills Continue Climbing

Cybersecurity has become a critical field in every industry and demand for those skills is gaining traction.

The skills changing within each individual job look different. To take just two examples, top emerging skills for a Barista (skill disruption score: 26.42 out of 100), include interpersonal communications and influencing skills, while for a Biologist (scoring 63.18), the top new skills required include management and mentorship.

But despite the diversity of jobs found throughout the labor market, a few key themes emerge. One in

particular comes as no surprise: what's been the greatest change in the labor market since 2021? The introduction and widespread adoption of **artificial intelligence**. We see this at play in both tech and non-tech roles.

The other two themes would also probably be unfamiliar to workers a generation ago: sustainability (green jobs) and cybersecurity. Not only are these emerging industries, they all represent an aspect of

modern life that has grown to encompass roles across the labor market. These three themes are also similar in that they began as specific niches, the realm of small groups of specialists, and have grown to affect a wide range of roles.

On a more technical note, they also share the distinction of being Lightcast sectors, a classification system we designed specifically to highlight trends in the labor market that are shared between occupations and industries.

Adapting to AI

It would be difficult to overstate the growth in job postings referencing generative AI, because it's difficult to understand just how small the demand was before the release of ChatGPT in November 2022. But the data can still provide an answer:

Generative AI postings are up 15,625% from 2021 to 2024.

In other words, that enormous percentage means that there were over 156 times as many generative AI postings in 2024 than there were in 2021.

Tech jobs have been notably disrupted by AI skills, including in data roles (like Data Scientists, Analytics Managers, and Data Engineers); programming roles (like Computer Scientists and Software Developers), and designers (including Web Developers, Industrial Designers, and UI / UX Designers). Chatbots are especially adept at generating code relative to other types of text, and copilot programs are prevalent in many situations. Image generation is now also common in popular design programs like Figma and Adobe Photoshop.

But what's unusual about Generative AI is that it has broken containment and spread to other industries that are far less technical. Writing-related occupations (including in education and marketing) are among the most likely to be affected, including the occupations of Technical Writer, SEO Specialist, Curriculum Designer, Digital Content Producer, and Social Media Specialist.

Note: [“Artificial Intelligence” as a specific skill in the Lightcast Open Skills Library](#) is defined as “creating intelligent machines that can simulate human intelligence and perform tasks that typically require human intelligence”

The demand for AI skills is skyrocketing

Share of Total Job Postings Requiring AI Skills

Source: Lightcast

This chart shows the proportion of all job postings in the US that request AI skills—so while the percentages on the left are small on their own, they actually represent millions of jobs. More notable is the growth: for “Artificial Intelligence” and “Generative Artificial Intelligence” especially, the share has grown exponentially to many times their size compared to just a few years ago.

Workforce Planning Tips

It's one thing to understand that AI is fundamentally reshaping the way everyone works, but knowing what to do about it is something else entirely. Knowing that AI skills have undergone an enormous spike in demand and importance, how does that reshape your workforce strategy? Here are three strategies to consider.

1. Try out the tools. The overarching theme of AI's entry into the workforce is a lot to take in—perhaps even too much. But if you break it down into specific use cases, understanding its value (or lack thereof) becomes much easier. By testing out AI tools and assessing whether they're useful for your workflow or your organization's needs, you'll be better equipped to know whether AI skills are worth including in your own job postings or training programs. Tools you might try could include Midjourney for image generation, ChatGPT or Google Gemini for text generation, Perplexity AI for research and search, GitHub Copilot for coding, or Adobe Firefly for creative design tasks. Approaching AI with blind eagerness is just as unhelpful as approaching it with stubborn reluctance.

2. Identify trends in specific roles and career pathways. At this point, Lightcast analysis shows AI augmenting jobs, not replacing them, and adoption varies by occupation and industry. In HR jobs, for example, AI has the opportunity to help identify internal skill gaps and develop internal talent, increasing the number of well-matched candidates, and planning for employee growth and location needs. (the Lightcast guide [“How to Use AI in HR — Intelligently”](#) goes into more detail on these).

Expect AI to become a normal part of most jobs, and to give an edge in efficiency for specific tasks. It's especially important to use real-world data to understand the trends actually happening in the labor market, even if they clash with conventional wisdom. For example, automation has often come for lower-skilled jobs in the past (those that do not require extensive education or training), but in fact, AI has had more of an impact levelling the playing field for entry to mid-level professionals in office settings.

Identifying which AI skills help people progress in their careers is key for training, upskilling, and reskilling them to make them more employable, productive, and future-ready.

3. Explore The Map. Even if AI tools are available anywhere there's an internet connection, workers with specific AI skills are still concentrated in different areas around the world. If you're looking to make a bigger AI push in your organization, it would be wise to start by looking at what specialized capabilities are most prevalent among workers in your region. The reverse is also true: in identifying how to best train local workers and learners, you can start by understanding what AI skills local employers want to see developed. ([The Lightcast Global AI Skills Outlook](#) provides a useful country-by-country guide to skill demand by country, and [Lightcast's contributions to the annual Stanford AI Index](#) also provide a state-by-state analysis of AI demand in the US.)

The Growth of Green Skills

The green economy is bigger and more diverse than appears at first glance: it includes not only engineers and laborers designing and installing solar panels, but also corporate roles like finance and marketing in the firms where they work, or HVAC technicians who now also work with new, energy-efficient units.

Overall, green skills (related to clean and renewable energy) have seen 31% growth from 2021 to 2024.

The increase in green skills is coming from green jobs but also from jobs that are becoming green—similar to the way AI has expanded from tech to non-tech.

Three years ago, less than 0.5% of Case Worker job postings asked for a green skill; now 53% of them do. Over the same period, the share of Data Scientist postings increased from 10% to 51%, likely because the environmental impact of high computer use is dramatic, and anyone using a lot of processing power needs to be conscious of efficiency.

Nuclear energy has emerged as a critical component of the green economy, particularly given its relevance to powering AI infrastructure and data centers. [Amazon, Microsoft, Google, and Oracle have all invested in new nuclear projects to help provide power to data centers.](#) McKinsey

estimates that [data centers will more than triple their energy demand](#) from 2024 to 2030, from 25 gigawatts to over 80.

The rise of green skills in non-green jobs underscores the importance of looking at skills, rather than titles or industries, to understand the forces shaping our labor market. Assuming that sustainability was limited to specialized tasks like wind turbine manufacturing would lead to an inaccurate view of how many green skills are actually being needed throughout the labor market.

Overall, the landscape of green skills has evolved significantly over the past three years. Environmental data analysis and skills related to electric vehicles (EVs) have shown

remarkable growth, while expertise in policy frameworks, particularly ESG (environmental and social governance) and environmental planning, has become increasingly crucial across many sectors.

Workforce Planning Tips

Perhaps it goes without saying that a transition to more sustainable energy and environmental policies will take buy-in from organizations of every size across the economy. But that's not just a rallying cry for the eco-conscious: the green economy is an undeniably massive

force in the labor market, creating an increasing need for green skills. The application is clear if you're already building electric vehicles or training workers in nuclear power roles. But what takeaways are there for the rest of the labor market?

1. Refocus on Reskilling: Adjacent skills are vital for workforce development. The growth in what we call "[green-enabled jobs](#)"—which are tangential to the green economy but require green skills, like mechanics working on both conventional and electric vehicles—shows a path forward to applying existing workers and their skills toward new ends. If a new technology grows in importance

as an old one fades, workers who make the switch between the two have the most to benefit.

2. Expand Your Green Horizon:

If the green economy touches more occupations and industries than are apparent on first glance, that also means there are more corresponding opportunities for workers and skills. From infrastructure to supply chain management, green competencies are increasingly valuable across business functions, making them relevant to every organization's future strategy.

The skills of Environmental Data Analysis and EV Installation have both seen huge growth over the past three years. Beyond those, many other green skills have risen at very similar rates.

Growth from 2021 to 2024

Source: Lightcast

Cybersecurity Skills Continue Climbing

Job postings show that [the cybersecurity workforce has expanded each year since 2013](#), and an estimated 1.25 million people work in cybersecurity roles throughout the US: and yet there are only enough workers to fill 83% of the available jobs. Demand for cybersecurity skills is incredibly high across a wide range of occupations across several functions.

Management Roles:

- Scrum Masters, which have seen 214% growth in the specific “Cyber Security” skill, increasingly need to integrate security considerations into agile

workflows, ensuring that security testing is built into sprints and that security requirements are properly prioritized.

- Compliance Managers must understand data security regulations, privacy requirements, and security controls, particularly as they handle sensitive business intelligence and ensure regulatory compliance. They’ve seen an increase in specialized skills including virtual private networks (VPNs), security requirements analysis, and NIST 800-53.
- These roles often serve as bridges between security teams and other departments.

Tech Roles:

- UI/UX Developers have seen a 256% increase in the “Cyber Security” skill. These designers are needing to incorporate security through understanding authentication best practices and secure data handling in user interfaces.
- Data/Mining Analysts need expertise in secure data handling practices, encryption, and data privacy to protect sensitive information during analysis. They have seen an 83% growth in demand for information privacy skills.
- Database Administrators, which have seen an 86% growth in

encryption and data encryption skills, need to use those skills to maintain security, while also implementing access controls and monitoring for unusual patterns that might indicate breaches.

Science/Health Roles:

- Biomedical Equipment Technicians (570% Cyber Security growth) must ensure medical devices are protected against cyber threats, particularly as these devices become more connected.
- Laboratory Technicians (385% Cyber Security growth) work with sensitive patient data and research information, requiring knowledge of data protection protocols and secure laboratory systems.

- This security dimension adds another layer of complexity and responsibility to these growing roles, reflecting how cybersecurity has become integral to virtually every professional function.

Workforce Planning Tips

1. Hire with Security in Mind.

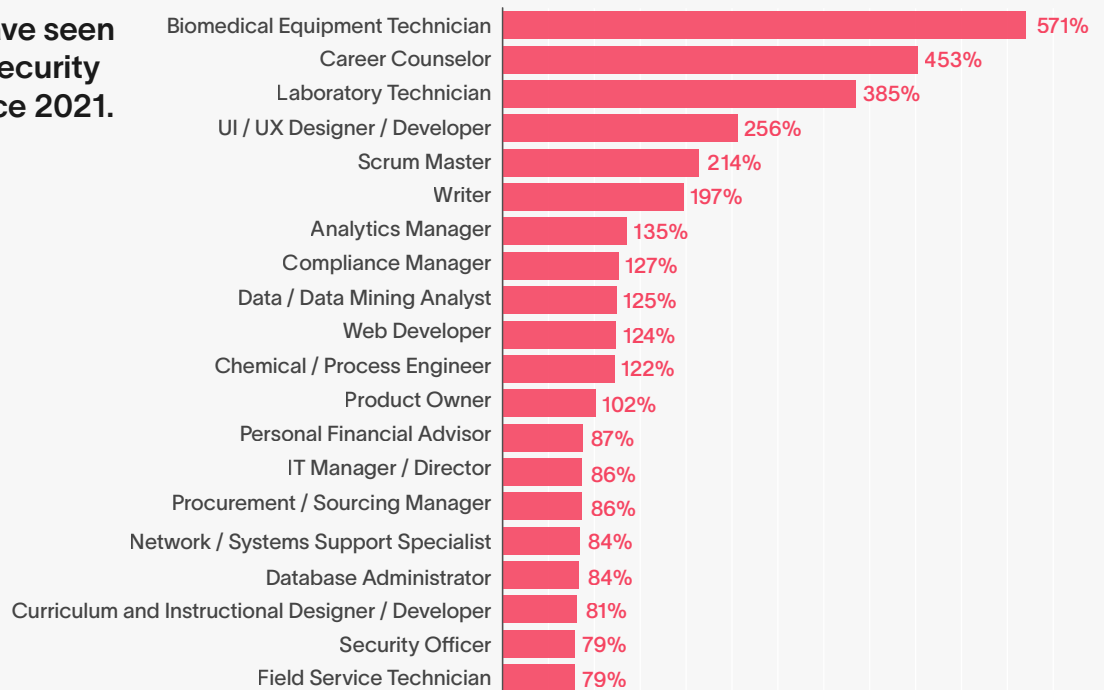

Every new role should incorporate cybersecurity competencies into its core requirements, from a Lab Technician's understanding of data privacy to a Scrum Master's ability to prioritize security features. This isn't just about technical skills; it's about developing security awareness as a fundamental professional competency, similar to communication or problem-solving skills.

2. Make Cybersecurity a Business

Priority: In today's interconnected workplace, a security breach in any function can paralyze entire operations, and the message is clear: cybersecurity is essential to business functioning. It's rare for a week to go by without hearing of another major data breach in the public and private sectors. Whether it's compromised patient data in healthcare, leaked business intelligence in analytics, or vulnerable user interfaces in product development, security failures in any role can trigger company-wide shutdowns. This makes cybersecurity not just an IT priority, but a core business imperative that needs to be embedded across all functions.

Many diverse jobs have seen their need for cybersecurity skills rise sharply since 2021.

Growth from 2021 to 2024 in a Cybersecurity Skill

Source: Lightcast

Conclusion

So far, the 2020s have been a decade of rapid change, and the evolution of skills across the labor market has profound implications for businesses, communities, learning institutions, and individuals. This transformation demands a forward-looking approach to prepare for what's next across several functions, including talent acquisition, employee reskilling and upskilling, and job training and development. Moving ahead of the curve as skills shift so quickly isn't easy, but it's necessary.

By using data to quantify the overall scale of skill change and identifying the specific nature of those changes, we can identify emerging skills, pick out key trends, and move toward growth and away from obsolescence.

Here's what that might look like for a few key stakeholders:

Business Leaders

By staying on top of technological advancements, new best practices, and other factors affecting skill

change, employers will need to be increasingly specific and focused about their core business functions. Assess how roles must evolve in terms of skills, capacity, and speed to align with strategic direction. Encourage a shift from incrementalism to bold, proactive measures to adapt to industry-wide changes. Skill changes are happening so rapidly that if your business is caught off-guard, your work can be disrupted overnight, making it vital to stay ahead of the curve.

HR Teams

The first step is to focus on your job architecture and assess what skills you need to run your organization—from there, several new opportunities open up. Partner with leadership to develop talent-sourcing strategies that address skill and capacity needs. Leverage learning and development functions to equip workers with essential skills. Foster collaboration between HR departments (L&D, recruiting, talent management, and people analytics) to implement holistic approaches. Empower HR business partners to bridge the gap between business needs and HR capabilities, enabling customization, agile experimentation, and tailored solutions.

Government

The rapidly changing skill landscape means public-sector leaders will need to proactively support their members through this transition. This involves creating support networks, local learning initiatives, and collaborative

platforms that enable continuous skill development. Communities should foster an environment of adaptability, where individuals are encouraged to embrace lifelong learning and view skill acquisition as an ongoing journey rather than a one-time achievement. This might include establishing local learning hubs, creating mentorship programs, and developing flexible, accessible learning opportunities that accommodate diverse work and life responsibilities, all while keeping an eye on the future and understanding specific workforce trends for your region.

Individuals

Embrace lifelong learning as a necessity for career longevity. Seek out employers and programs that support skill development and career advancement. Proactively addressing skill challenges and opportunities enables organizations, individuals, and society to navigate the dynamic talent landscape and thrive in the age of constant disruption.

Higher Education

In an evolving labor market, higher ed institutions have a unique opportunity to position both themselves and their students for success by aligning academic offerings with demand for future-ready skills. Labor market insight provides essential guidance by illuminating how macro trends impact the industries and regions most relevant to each institution. With this data, academic leaders can strategically embed future-ready skills into existing programs, design new offerings to meet emerging needs, and explore ways to support lifelong learning through flexible, non-degree credentials for upskilling and reskilling. Strengthening industry partnerships further ensures that education stays closely aligned with shifting workforce requirements. This alignment drives alumni success, reinforces institutional reputation, and attracts prospective students in an increasingly competitive higher education landscape.

Appendix

Methodology

The Skills Disruption Index measures how occupations across the United States have changed in terms of employer skills requirements. To calculate this, we analyzed the change in skill share for every Lightcast occupation between 2021 and 2024, and indexed them from 0-100 according to skills change. The higher the ranking, the higher the level of skills change.

Lightcast scans millions of job postings in the US every day and analyzes them using artificial intelligence technologies. These job postings are gathered by scraping thousands of job boards, online newspapers, and employer websites on a daily basis. They are cleaned and deduplicated to ensure only one posting is counted for each opening—regardless of how many places it is advertised in. Job postings are then classified by location, industry, occupation, skills required and any other type of relevant information that can be extracted from the advertisement, using a combination of official and proprietary taxonomies.

Drawing on data sourced from more than 2.5 billion online job postings from 2021-2024, we examined skill requests as well as their evolution over time. In each year, we looked at the proportion of each job that requires a skill and then tracked that skill to see how the proportion changed over time. To build this version of the Skill Disruption Index, we calculated the absolute value of the difference in proportions from 2021 through the fourth quarter of 2024. We then adjusted these differences based on the salary premium for each skill and a measure of the number of occupations the skill affected. These adjustments increase the weight on skills that command a high premium and that are in demand across a wide range of occupations. Next, we summed the changes for each occupation and normalized them to result in an index between 0 and 100.

We then compared the recent 3-year timeframe from 2021-2024 to the previous period we'd analyzed in a prior report (2016-2021) to draw a comparison between the rates of skill change for the current 3-year period and the previous 5-year period.

Our analysis includes 599 occupations based on [Lightcast's proprietary taxonomy of occupations](#). It also includes more than 32,000 skills developed by Lightcast and tagged in job-posting data.

Appendix

Skill Disruption Index Table

Career Area	Occupation	Skill Disruption Index
1. Information Technology and Computer Science	Computer Scientist	93.7
2. Information Technology and Computer Science	Mobile Applications Developer	89.9
3. Information Technology and Computer Science	Chief Information Officer	89.5
4. Information Technology and Computer Science	Statistician	88.7
5. Information Technology and Computer Science	Biostatistician	87.8
6. Information Technology and Computer Science	Web Developer	84.8
7. Information Technology and Computer Science	Analytics Manager	82.0
8. Engineering	Sustainability Specialist	78.7
9. Finance	Tax Examiner / Collector	76.9
10. Sales	Sales Engineer	76.1
11. Engineering	Biomedical Engineer	76.0
12. Engineering	Energy Engineer	75.8
13. Marketing and Public Relations	Search Engine Optimization Specialist	75.5
